Go Direct® 3-Axis Magnetic Field
(Order Code GDX-3MG)

Go Direct 3-Axis Magnetic Field allows you to determine the magnitude and direction of the magnetic field at any point in space. It directly connects wirelessly via Bluetooth® or wired via USB to your platform.

Note: Vernier products are designed for educational use. Our products are not designed nor are they recommended for any industrial, medical, or commercial process such as life support, patient diagnosis, control of a manufacturing process, or industrial testing of any kind.

What's Included
- Go Direct 3-Axis Magnetic Field
- Rechargeable battery (included inside unit)
- Micro USB Cable

Compatible Software
See www.vernier.com/manuals/gdx-3mg for a list of software compatible with Go Direct 3-Axis Magnetic Field.

Getting Started
Please see the following link for platform-specific connection information:
www.vernier.com/start/gdx-3mg

Bluetooth Connection
1. Install Graphical Analysis 4 on your computer, Chromebook™, or mobile device. If using LabQuest 2, make sure LabQuest App is up to date. See www.vernier.com/ga4 for Graphical Analysis 4 availability or www.vernier.com/downloads to update LabQuest App.
2. Charge your sensor for at least 2 hours before first use.
3. Turn on your sensor by pressing the power button once. The LED will blink red.
4. Launch Graphical Analysis 4 or turn on LabQuest 2.
5. If using Graphical Analysis 4, click or tap Sensor Data Collection. If using LabQuest 2, choose Wireless

USB Connection
1. If using a computer or Chromebook, install Graphical Analysis 4. If using LabQuest 2, make sure LabQuest App is up to date. See www.vernier.com/ga4 for Graphical Analysis 4 availability or www.vernier.com/downloads to update LabQuest App.
2. Connect the sensor to the USB port.
3. Launch Graphical Analysis 4 or turn on LabQuest 2. You are now ready to collect data.
4. This is a multi-channel sensor. To change the channel selections, see www.vernier.com/start/gdx-3mg

Device Setup > Go Direct from the Sensors menu.
6. Select your Go Direct sensor from the list of Discovered Wireless Devices. Your sensor's ID is located near the barcode on the sensor. The LED will blink green when it is successfully connected.
7. Click or tap Done. You are now ready to collect data.
8. This is a multi-channel sensor. To change the channel selections, see www.vernier.com/start/gdx-3mg

Charging the Sensor
Connect Go Direct 3-Axis Magnetic Field to the included Micro USB Cable and any USB device for two hours.
You can also charge up to eight Go Direct 3-Axis Magnetic Field Sensors using our Go Direct Charge Station, sold separately (order code: GDX-CRG).

## Identifying the Sensor

When two or more sensors are connected, the sensors can be identified by tapping or clicking Identify in Sensor Information.

## Using the Product

Connect the sensor following the steps in the Getting Started section of this user manual.

### Channels

Go Direct 3-Axis Magnetic Field has 6 measurement channels. The channel names are:
- X magnetic field
- Y magnetic field
- Z magnetic field
- X magnetic field 130mT
- Y magnetic field 130mT
- Z magnetic field 130mT

The default channel that is active when connected is the X magnetic field channel, which has a maximum range of ±5 mT. This range works well for the experiments we have published in our lab manuals.

There are two additional channels that use the ±5 mT range, Y magnetic field and Z magnetic field. The y- and z-directions are indicated by the dots impressed in the plastic near the end of the wand. These marks also indicate the location of the actual sensor chip within the wand.

When using any of the ±5 mT channels, if the sensor is exposed to a magnetic field greater than ±5 mT on any axis, the software will display a reading of 5 mT. To measure the field strength of stronger magnetic fields, use the 130 mT channels. The 130 mT channels are measured by a second sensor chip inside the wand, located 5.5 mm toward the handle from the dots in the end of the wand.

## Measuring the X-direction Magnetic Field

Magnetic fields that point in the same direction the wand is pointing are recorded as positive, and fields that point in the opposite direction are recorded as negative. Thus, the magnetic field of the Earth will register as a positive field when the wand is pointed toward the magnetic pole in the Earth’s northern hemisphere, which is a South magnetic pole. When the wand is aligned with a permanent magnet and pointed toward the South pole of a magnet it will also record a positive field.

![Diagram showing the positive x-direction measurement](image)

The x-direction measurement is positive when the wand points toward the South pole of a magnet.

## Measuring y- and/or z-directions

The marks on the sides of the wand, at the tip, indicate the y- and z-directions of positive magnetic field measurements, as well as marking the location within the housing where the ±5 mT magnetic field sensor is located. This is important for consistent placing of the sensor and accurately measuring the distance between the sensor and the source of a magnetic field.
In this orientation, the z-direction measurement will be positive.

**Measuring Magnitude**
This sensor measures just the vector component of the field along each direction. To determine the total magnetic field strength at a location, you could measure only in the x-direction (the default setting in Graphical Analysis) and point the wand exactly in the direction of the magnetic field in the location you are measuring. Another option is to create a calculated column in software. The magnitude of the field is calculated as the square root of the sum of the squares of the measurements along all three axes. Using this method may be useful with students who have been introduced to vectors in three dimensions.

**Videos**
View videos related to this product at [www.vernier.com/gdx-3mg](http://www.vernier.com/gdx-3mg)

**Calibrating the Sensor**
User calibration is not available for this sensor. We have set the sensor to match our stored calibration before shipping it.

It is useful, however, to zero Go Direct 3-Axis Magnetic Field. Position the sensor and zero it using your data-collection software. Moving the sensor will upset the zero since the background magnetic field in your lab probably varies with position. For experiments measuring the spatial variation of a magnetic field, it is better to zero the sensor and then move the source to various positions.

### Specifications

| **Maximum wireless range**    | 30 m (unobstructed)                        |
| **Dimensions**                | 19 cm long, wand portion 12.2 cm long      |
|                               | Wand tapers from 0.8 cm square at handle to 0.7 cm square at tip. This sensor is designed to be placed inside a solenoid if needed. |
| **Battery**                   | 300 mA Li-Poly                             |
| **Battery life (single full charge)** | ~24 hours continuous data collection       |
| **Battery life (long term)**  | Several years depending on usage           |

### Care and Maintenance

**Battery Information**
Go Direct 3-Axis Magnetic Field contains a small lithium-ion battery in the handle. The system is designed to consume very little power and not put heavy demands on the battery. Although the battery is warranted for one year, the expected battery life should be several years. Replacement batteries are available from Vernier (order code: GDX-BAT-300).

**Storage and Maintenance**
To store Go Direct 3-Axis Magnetic Field for extended periods of time, put the device in sleep mode by holding the button down for at least three seconds. The red LED will stop flashing to show that the unit is in sleep mode. Over several months, the battery will discharge but will not be damaged. After such storage, charge the device for a few hours, and the unit will be ready to for use.

Exposing the battery to temperatures over 35°C (95°F) will reduce its lifespan. If possible, store the device in an area that is not exposed to temperature extremes.
Water Resistance
The wand portion of Go Direct 3-Axis Magnetic Field is water resistant and can be submerged in water. No part of the handle is submersible.

How the Sensor Works
The ±5 mT chip in Go Direct 3-Axis Magnetic Field uses a device based on anisotropic magnetoresistance. In certain materials, the electrical resistance varies with the external magnetic field strength and the angle between the current and the field. Using this effect one can measure the component of the magnetic field along each axis.

The ±130 mT chip in the sensor uses a Hall-effect transducer. It produces a voltage that is linear with magnetic field.

Repair Information
If you have followed the troubleshooting steps and are still having trouble with your Go Direct 3-Axis Magnetic Field, contact Vernier Technical Support at support@vernier.com or call 888-837-6437. Support specialists will work with you to determine if the unit needs to be sent in for repair. At that time, a Return Merchandise Authorization (RMA) number will be issued and instructions will be communicated on how to return the unit for repair.

Warranty
Vernier warrants this product to be free from defects in materials and workmanship for a period of five years from the date of shipment to the customer. This warranty does not cover damage to the product caused by abuse or improper use. This warranty covers educational institutions only.

Disposal
When disposing of this electronic product, do not treat it as household waste. Its disposal is subject to regulations that vary by country and region. This item should be given to an applicable collection point for the recycling of electrical and electronic equipment. By ensuring that this product is disposed of correctly, you help prevent potential negative consequences on human health or on the environment. The recycling of materials will help to conserve natural resources. For more detailed information about recycling this product, contact your local city office or your disposal service. Battery recycling information is available at www.call2recycle.org

Do not puncture or expose the battery to excessive heat or flame.

The symbol, shown here, indicates that this product must not be disposed of in a standard waste container.

Federal Communication Commission Interference Statement
This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

FCC Caution
This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:

1. this device may not cause harmful interference and
2. this device must accept any interference received, including interference that may cause undesired operation.

RF Exposure Warning
The equipment complies with RF-exposure limits set forth for an uncontrolled environment. The antenna(s) used for this transmitter must not be co-located or operating in conjunction with any other antenna or transmitter. You are cautioned that changes or modifications not expressly approved by the party responsible for compliance could void your authority to operate the equipment.

IC Statement
This device complies with Industry Canada license-exempt RSS standard(s). Operation is subject to the following two conditions:

1. this device may not cause interference, and
2. this device must accept any interference, including interference that may cause undesired operation of the device.

Industry Canada - Class B
This digital apparatus does not exceed the Class B limits for radio noise emissions from digital apparatus as set out in the interference-causing equipment standard entitled "Digital Apparatus," ICES-003 of Industry Canada. Operation is subject to the following two conditions: (1) this device may not cause interference, and
2. this device must accept any interference, including interference that may cause undesired operation of the device.

To reduce potential radio interference to other users, the antenna type and its gain should be so chosen that the equivalent isotropically radiated power (e.i.r.p.) is not more than that permitted for successful communication.

RF exposure warning: The equipment complies with RF exposure limits set forth for an uncontrolled environment. The antenna(s) used for this transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

Le présent appareil est conforme aux CNR d’Industrie Canada applicables aux appareils radio exempts de licence. L’exploitation est autorisée aux deux conditions suivantes:
1. L’appareil ne doit pas produire de brouillage, et
2. L’appareil doit accepter tout interférence radioélectrique, même si cela résulte d’un brouillage susceptible d’entraver le fonctionnement.

Cet appareil numérique respecte les limites de bruits radioélectriques applicables aux appareils numérisques de Classe B prescrites dans la norme sur le matériel informatique "Appareils Numériques," NMB-003 édictée par Industrie Canada. L’utilisation est soumise aux deux conditions suivantes:
1. cet appareil ne peut causer d’interférences, et
2. cet appareil doit accepter toutes interférences, y compris celles susceptibles de provoquer un fonctionnement du dispositif.

Afin de réduire les interférences radio potentielles pour les autres utilisateurs, le type d’antenne et son gain doivent être choisis de telle façon que l’équivalent de puissance isotrope émise (e.i.r.p.) n’est pas plus grand que celui permis pour une communication établie.

Avertissement d’exposition RF: L’équipement est conforme aux limites d’exposition aux RF établies pour un environnement non supervisé.

La ou les antennes (s) utilisée pour ce transmetteur ne doit pas être jumelé ou fonctionner en conjonction avec toute autre antenne ou transmetteur.

Note: This product is a sensitive measurement device. For best results, use the cables that were provided. Keep the device away from electromagnetic noise sources, such as microwaves, monitors, electric motors, and appliances.
